Agenda

- Introduction
- Different ink types and printing technologies
- Typical ink ingredients
- Requirements for the inks for shrink sleeves
- Tips for water based and solvent based printing
- Deep dive into UV curable inks
- Summary

25 - 27 September • Chicago
**LABELXPO
AMERICAS 2018**

Role of packaging

protection - increase of shelf life

Brand Recognition

Eye Catching Packaging

25 - 27 September • Chicago

**LABELXPO
AMERICAS 2018**

www.labelexpo-americas.com

Attractiveness of shrink sleeves

Eye catching

Possibility to differentiate (360° info)

High quality printing

High resistance (scratch & chemical) properties

Food safety

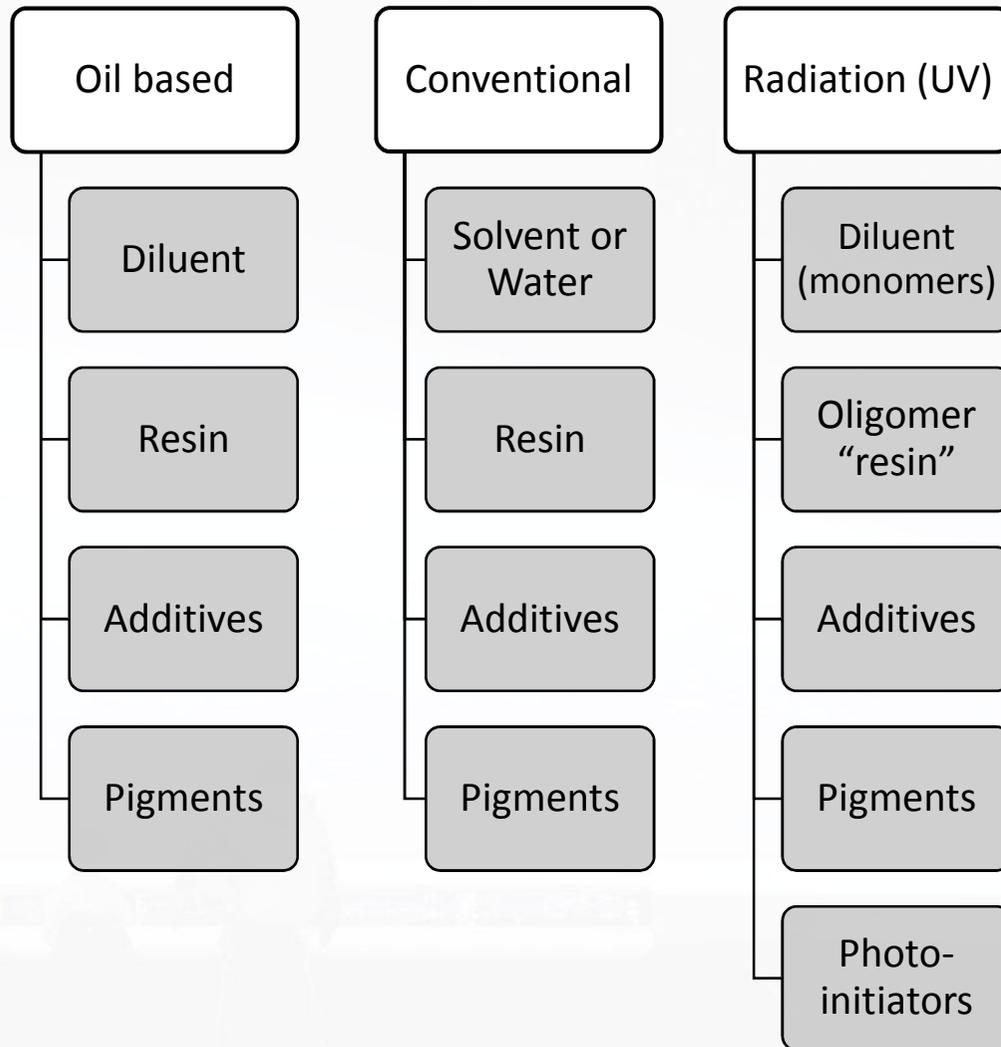

25 - 27 September • Chicago

Typical ink ingredients

Ingredients	Ink types			
	Solvent-based	Water-based	Oil-based	UV curing
Pigments	Yes	Yes	Yes	Yes
Resins	Nitrocellulose	Acrylic	Phenolic Alkyd	Oligomers
Diluents	Solvents	Water/amine	Mineral / Vegetable Oil	Monomers
Solvents	> 30%	< 5%	0	0
Additives	Wax Antifoam Silicones Plasticizers	Wax Antifoam	Wax Stabilizers Fillers	Wax Photo initiator Stabilizers

Pigments

- Pigments
 - physically & chemically stable
 - non-soluble
- Denoted by Color Index Number (CI#)
 - Red 57.1, Red 184, Red 177
- CI# indicates properties
 - hue, fastness, cost....
 - important to know CI#!
- Organic nature
 - Pyrazolene, Disazo, Naphthol, Pthalocyanine, Quinacridone
- Inorganic
 - Titanium Dioxide
 - Iron Oxides
 - Metallic

25 - 27 September • Chicago
LABELXPO

www.labelexpo-americas.com

Resins

- Typical resins used
 - Nitrocellulose
 - Polyamide
 - Acrylic (styrene and acrylic acid)
 - Phenolic
 - Epoxy Acrylates, polyester acrylates, etc...: used in UV/EB inks & coatings
 - Urethanes, Polyesters: used in solvent based inks & coatings
- This is the backbone of the ink!
- Will affect adhesion, flexibility, resistance properties, speed of drying/curing, and overall end performance of printed material

25 - 27 September • Chicago
**LABELEXPO
AMERICAS 2018**
www.labelexpo-americas.com

Diluents

- Used to reduce viscosity, to “thin” the ink
- Most common is H₂O for waterbased inks
- UV inks use monomers
- Diluents will affect dry/cure speeds also

25 - 27 September • Chicago
**LABELXPO
AMERICAS 2018**
www.labelexpo-americas.com

Additives

- Defoamers
- Waxes/Silicones (Coefficient Of Friction=COF)
- Matting agents
- Photoinitiators for UV inks
- Adhesion promoters
- Surfactants
- Optical Brighteners

25 - 27 September • Chicago

**LABELEXPO
AMERICAS 2018**

Requirements for inks for shrink sleeves

- Very high color strength
- High cure speed
- Excellent press & print performance
- Ability to shrink (so flexibility !)
- Adhesion to wide range of substrates (PET-G, PVC, OPS, PLA,....)
- Good surface slip properties, especially for ink on the last printing station (usually white)

25 - 27 September • Chicago
**LABELEXPO
AMERICAS 2018**
www.labelexpo-americas.com

Why is white ink so important?

- Usually last down so COF is very important
- Scratch resistance, adhesion and flexibility
- Opacity, adhesion and flexibility
- Low COF (high slip) – last down
- High COF (low slip) – first down
- Some people will print single bump of white and up to 3 bumps to get opacity and performance

25 - 27 September • Chicago
**LABELXPO
AMERICAS 2018**
www.labelexpo-americas.com

Tips for printing water based inks

- Proper anilox roller selection and press speed
- Ensure proper drying in order to reach the desired properties (adhesion and scuff resistance) as well as to prevent blocking in the rewind
- Catalyze the inks (whites/last down) if steam tunnel is used for shrinkage
- pH maintenance is critical!

25 - 27 September • Chicago
**LABELEXPO
AMERICAS 2018**
www.labelexpo-americas.com

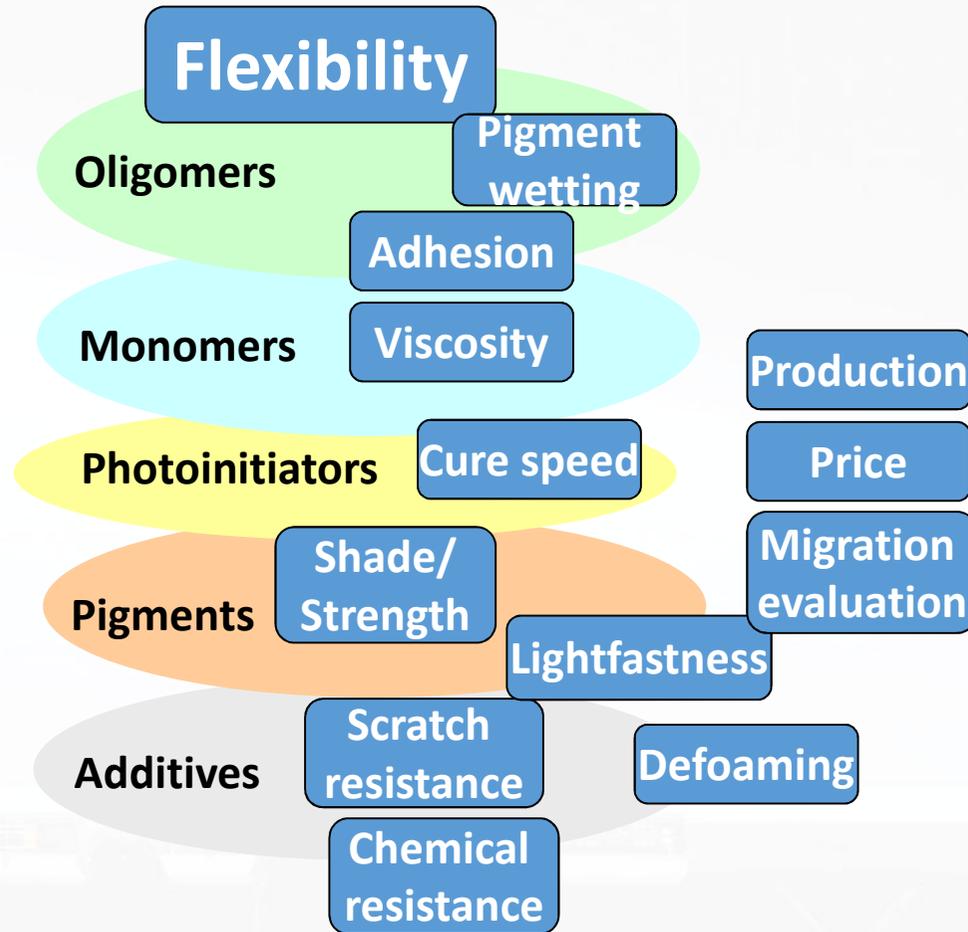

Tips for printing solvent based inks

- Correct solvent selection is important as some solvents like e.g. acetates damage the film, leading to e.g. whitening
- No retained solvent in inks after drying as this can affect shrink performance, so a combination of proper air drying with right viscosity is important

25 - 27 September • Chicago

Deep dive into UV inks: designing a Low Migration UV flexo ink

Designing Low Migration UV flexo inks

- Less building blocks available
- Excluding low molecular weight monomers prone to migrate
- Legislations and regulatory environment continuously moving
- Increased awareness among local brand owners

Design window for Standard UV inks

Design window for low migration inks

Targeting a design window that gets smaller every year

Challenges with UV curable inks

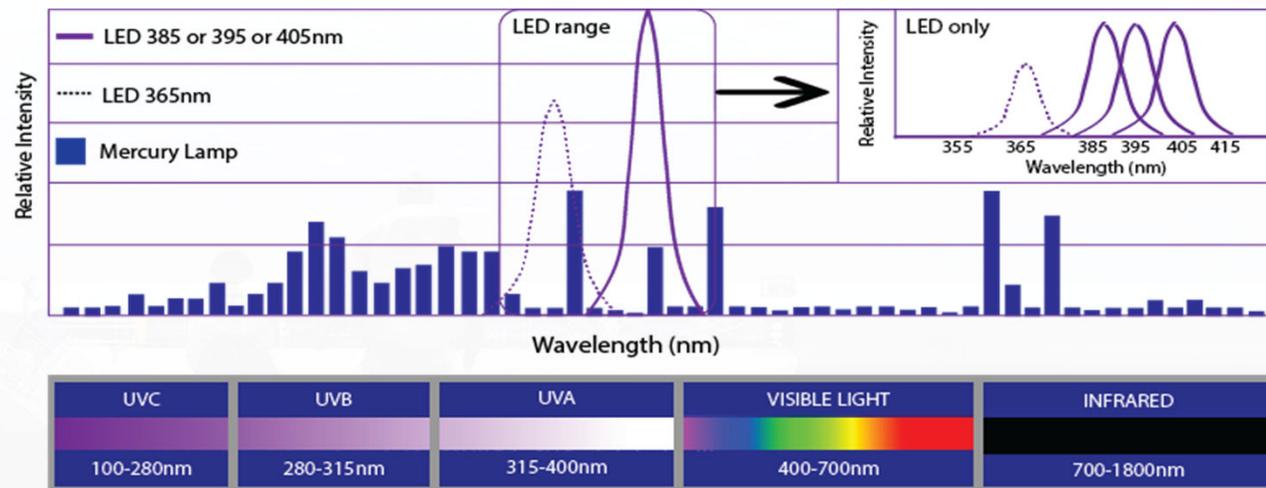

- Heat generation from UV lamps will distort films, especially thin films
- If you don't have the proper ink formulated for "cool UV" systems, then your UV inks may not cure as fast.....
- Often the chill roller is too cool
- All of these challenges can be addressed.....with UV LED curing

25 - 27 September • Chicago
**LABELXPO
AMERICAS 2018**
www.labelexpo-americas.com

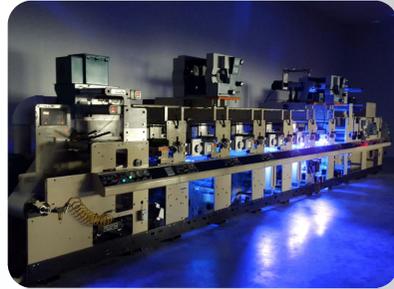

What is UV LED?

- UV LED means UltraViolet Light Emitting Diode
- UV LED is an alternative for the traditional UV Hg lamp systems (different wavelength and intensity compared to conventional UV)
- Different ink chemistries are needed

25 - 27 September • Chicago
**LABELEXPO
AMERICAS 2018**
www.labelexpo-americas.com

Advantages of UV LED curing

IDEAL for Shrink Sleeves

Performance

- High color strength with excellent cure
- Reliable and consistent adhesion and printability
- Dual cure

Advanced Capabilities

- Useful for curing sensitive films, thin coatings and controlled curing intensity - consistent curing

Operating Economics

- Higher Productivity
 - Press UPTIME – less equipment faults
 - Faster cure
- Energy Efficient
- Long Lifetime & Low Maintenance
- Solid State: Instant on/off

Health and Environmental

- Mercury & Ozone Free
- Less Heat and Operating Noise

25 - 27 September • Chicago

**LABELXPO
AMERICAS 2018**

www.labelexpo-americas.com

Summary

- Shrink sleeves allow to make eye catching packaging and labels
- Inks are an important part of the shrink sleeves
- Requirements for the inks for shrink sleeves are quite stringent
- Not all inks will fit.....they must be specially designed and tested to achieve those performance requirements
